## **General information**

- Express Blower Benelux BV is a young, dynamic company specialized in replacing and yielding of compost, tree bark, wood cock/chips and peat. With its long flexible hose it can reach difficult accessible places up till 200 meter.
- Our enterprise is also a supplier of all of the products mentioned above and we are able to deliver soil improvable goods and bottom covering goods. We deliver products and advice based on the customer's needs.
- Because of the endless possibilities which the revolutionary technique of the Express Blower provides, it is possible to mix dry products, such as seeds, through our special soil blends. The Express Blower makes it also possible to inject fluids, like manure, humid sour and colour pigments. Blending all these liquids takes place during blowing process.
- An important specialization on producing a beautiful lawn, sports field or slope, the Express Blower now applies soil mix, fertilizer, and grass seed in one easy application, called Terraseeding™. After years of research, done by Express Blower Inc., Terraseeding™ is proven as one of the most effective methods available to stop erosion.
- For renovating or replacing a new lawn Express Blower introduces overseeding. When renovating or replacing lawns Express Blower blows a layer 1-2 cm on the existing lawn. This permits the existing lawn to keep growing. The layer which is blown on top of it is solely meant to sow damaged parts of the lawn and to feed it.
- An Ecoberm can be used virtually anywhere silt fence is used. Unlike silt fence, however, an Ecoberm has been proven to be 99% effective in fields of erosion control, is entirely organic, easily installed, requires little or no maintenance, and does not need to be torn down and discarded in a landfill. Hence, an Ecoberm is a solution to prevent filthy water drainage of roads to surface water and protection of construction territory.
- The European importer rights are given by Express Blower Inc. to Express Blower Benelux BV.

## **The Express Blower**

The express Blower is an exciting and professional addition to any landscape, erosion control, or construction business. It will increase productivity and efficiency and greatly improve your bottom line profit. Not only will an Express Blower add value to your business, but your customer will appreciate the faster, more convenient service of pneumatic application and the smooth finished appearance that only blower spreading can offer. When you consider the costs for labour, equipment, and time, you will never push another wheelbarrow again!

## **Save time, Save labour, Save money**

Operating by one person by remote control, the Express Blower allows you to quickly and efficiently spread large quantities of organic materials such as compost, tree bark, wood cock/chips, peat and several sorts of sand and grind up to 2 cm diameter, even to the remotest locations.

The Express Blower saves valuable time and labour costs. The Express Blower will spread five times what a 5 person crew can do in one day. It will also allow you to reduce your overall cost of spreading materials, eliminate unnecessary employee risk, and allow you to expand your business by greatly reducing your job completion times.

**1 man with the Express Blower**

**5 man with their wheelbarrow**

Hardwood, softwood, and coloured wood mulch have never been applied more effortless, and the smooth, professional look of the blown material is unrivalled. With the remote control, the volume of output can be adjusted quickly to a minimum flow for spreading around delicate flowers or turned up higher in more wide open areas.

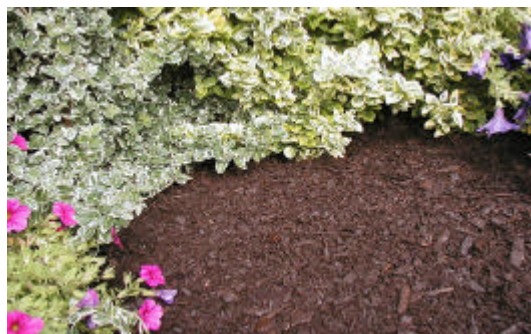

The quality of the product which is used combined with the total blow distance set the capacity of the Express Blower. This varies from 3 m to 40 m p/h.

By using the patented process the Express Blower can inject dry components, like compost with seeds and manure in the hose during the blowing process.

This technique makes it also possible to blend liquids (colour pigments, humid sour) with dry components. This makes it possible to colour mulch or wood chips. When colouring wood chip or other dry components the colour pigment should be well dosed and tested in advance.

For colouring wood chips by using iron oxide the Express Blower can colour the wood chips in red/brown. Iron oxide is a natural raw material and does not have a negative effect on the environment.

Make money with your Express Blower truck while it's not even out on a job. In those off-times, such as at night or on the weekends, produce coloured mulch or wood chips using our patented process. You have now created a premium product to sell at a premium price. Depending upon

your preference, mulch or wood chips can also be coloured on the job site as you apply the product.

### **Terraseeding™**

Terraseeding™ is the most effective seeding process available today. Express Blower's patented Supplemental Injection System provides precisely calibrated injection of seed and other granular components into the primary product such as compost and soil mixes. This exclusive process yields faster, more uniform germination and healthier turf.

Terraseeding™ helps protect the seed and allows it to root down into the soil. The seed does not lie on top of the soil exposed to the elements.

As you can see, after 20 days you have a beautiful mowing field.

Terraseeding™ is also perfect for new lawn installation, renovation, or for topdressing over existing lawn or turf, which we call overseeding. When renovating or replacing lawns Express Blower blows a layer 1-2 cm on the existing lawn. This permits the existing lawn to keep growing. The layer which is blown on top of it is solely meant to sow damaged parts of the lawn and to feed it.

### **Slope and verges**

Terraseeding™ is perfectly suitable for sowing slopes and verges. Because of the steep slope and the inaccessibility of the project is it often labour

intensive work and therefore very costly. The Express Blower with its long and flexible hose is able to reach inaccessible places. Even if bad weather causes an obstacle, the Express Blower can still do the job.

### **Ecoberms® and Ecoblankets**

Ecoberms® and Ecoblankets are environment friendly solutions for water drainage from roads and construction territory. When it rains a large amount of drainage from the road and construction territory floats into the surface water and causes pollution of the surface water.

By applying dykes (Ecoberms®) the drainage is being filtered in a biological manner. The compost of which the Ecoberm® consists is enriched by sieve fractions of Microblend®. Due to the activity of micro organisms in the Microblend® some harmful combinations are biodegradable decomposable.

The slopes can be foreseen of Ecoblankets. Ecoberm® and Ecoblankets can be sowed by means of Terraseeding™.
